SplitPot on Portaldot

Atomic multi-party payment splits in a single extrinsic

Portaldot Hacker House · Track: Ecosystem DApps · by jackzhu88

Problem

Teams, creators and DAOs constantly split revenue among several people

Paying each person separately = many txs, manual math, more fees

Partial failure leaves some paid and others not — trust breaks

Solution

Define payees + percentage shares once

SplitPot builds one utility.batchAll of balance transfers

All-or-nothing: every payee is paid, or none are

Open source, works on any Portaldot node

How it works

1. Input: total amount + shares (e.g. 50 / 30 / 20)
2. Compute each amount: total × share / 100
3. Compose N × Balances.transferKeepAlive calls
4. Wrap in Utility.batch_all, sign once, submit
5. Runtime executes atomically — any failure reverts the whole batch

Demo transactions (PortaldotV3 public testnet)

Public testnet proof

6 tPOT split 50/30/20 → 3 / 1.8 / 1.2 tPOT

Extrinsic 0xc13806ef8b6dfd916c33c64c60028e063946f74d0f7e6313d747f897e1b83d88

Explorer: scanner-testnet-v3.portaldot.dev/extrinsics/182786-1

Fee charged: 0.02360775504659 tPOT · block #182786 · UTC 2026-10-25T02:12:12Z

Earlier local/dev only (not public network)

0x07aa9f22ef952345…1192424b and 0xc6dfdb5e9dbfa1de…40f1 — local portaldot_dev --dev

Track fit: Ecosystem DApps

Real payment utility for Portaldot users from day one

Uses native runtime pallets — no extra contract risk

Building block for payroll, royalties, grant distribution

Simple to integrate into wallets and other DApps

Roadmap

Web UI with polkadot.js extension signing

Recurring splits via scheduled payouts

ink! contract for on-chain saved split configs

CSV import for large payee lists

Mainnet: never use //SplitPayee0..2 public Substrate dev URIs
