# SplitPot on Portaldot

Atomic multi-party payment splits in a single extrinsic

Portaldot Hacker House · Track: Ecosystem DApps · by jackzhu88

# Problem

- Teams, creators and DAOs constantly split revenue among several people
- Paying each person separately = many txs, manual math, more fees
- Partial failure leaves some paid and others not — trust breaks

# Solution

- Define payees + percentage shares once
- SplitPot builds one `utility.batchAll` of balance transfers
- All-or-nothing: every payee is paid, or none are
- Open source, works on any Portaldot node

# How it works

- 1. Input: total amount + shares (e.g. 50 / 30 / 20)
- 2. Compute each amount: `total × share / 100`
- 3. Compose N × `Balances.transfer` calls
- 4. Wrap in `Utility.batch_all`, sign once, submit
- 5. Runtime executes atomically — any failure reverts the whole batch

# Demo transactions (Portaldot dev chain)

- 10 POT split 50/30/20 → 5 / 3 / 2 POT
  `0x07aa9f22ef952345…5f256fc1192424b`
- 6 POT split 50/30/20 → +3 / +1.8 / +1.2 POT
  `0xc6dfdb5e9dbfa1de…eff1ae8793c7a90f4d694f40f1`
- One signature, one extrinsic, three payouts

Code: github.com/jackzhu88/splitpot-portaldot

# Track fit: Ecosystem DApps

- Real payment utility for Portaldot users from day one
- Uses native runtime pallets — no extra contract risk
- Building block for payroll, royalties, grant distribution
- Simple to integrate into wallets and other DApps

# Roadmap

- **Web UI** with polkadot.js extension signing
- **Recurring splits** via scheduled payouts
- **ink! contract** for on-chain saved split configs
- CSV import for large payee lists

# Team
